# Over forty invertebrate pests species threaten canola (Table 1 proceedings).

Potential losses are > \$300 million (Murray et.al. 2013)

**TABLE 7.9 Five most important invertebrate pests of canola by potential and present loss**

| Rank | By Potential Loss                                    | By Present Loss                         |
|------|--|---|
| 1    | Redlegged earth mite (\$96.6 million)                | Diamondback moth (\$10.3 million)       |
| 2    | Lucerne flea (\$29.7 million)                        | Redlegged earth mite (\$7.8 million)    |
| 3    | Blue oat mite (\$28.8 million)                       | Canola aphids (various) (\$5.1 million) |
| 4    | Canola aphids (various) (\$24.0 million)             | Weevils (various) (\$4.3 million)       |
| 5    | Bryobia (various) / Balaustium mite (\$19.3 million) | European earwig (\$4.2 million)         |

Pest reports (% of total reports)

| Early 1980's     | 2006/7            |
|------------------|-------------------|
| Aphids (9%)      | Aphids (22%)      |
| RLEM (8%)        | RLEM (14%)        |
| Cockchafers (7%) | BOM (9%)          |
| Budworm (7%)     | Lucerne flea (9%) |
| Cutworm (5%)     | Budworm (8%)      |

Title: The Current and Potential Costs of Invertebrate Pests in Australia

Hoffmann, et. al. 2008. Aust. J. Exp. Ag. 48: 1481-1493.

GRDC Project Code: AEP00001

Authors: Dr Dave Murray, Michael Clarke and David Ronning

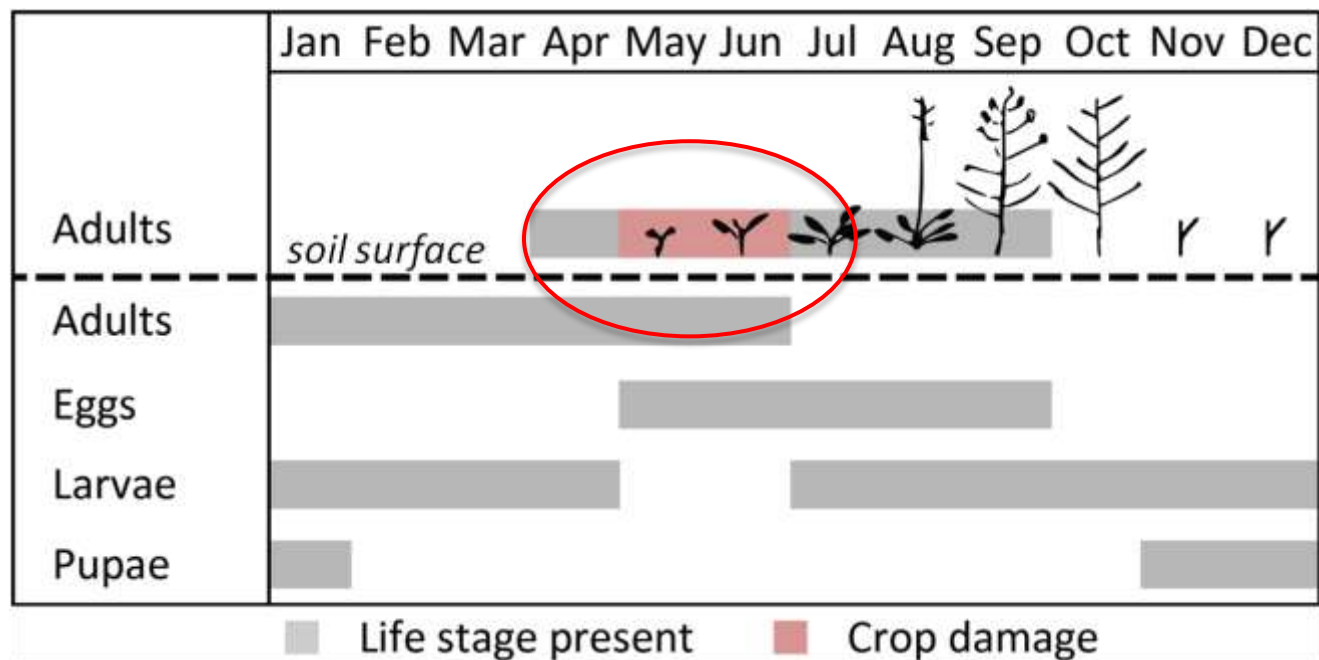

Figure 1 Recent Pest Reports from SE Australia 2012- July 2014

# Intangible pests: e.g. Weevils

- Sexual reproduction, one generation per year
- **Critical period is May/June** (peak adult emergence)

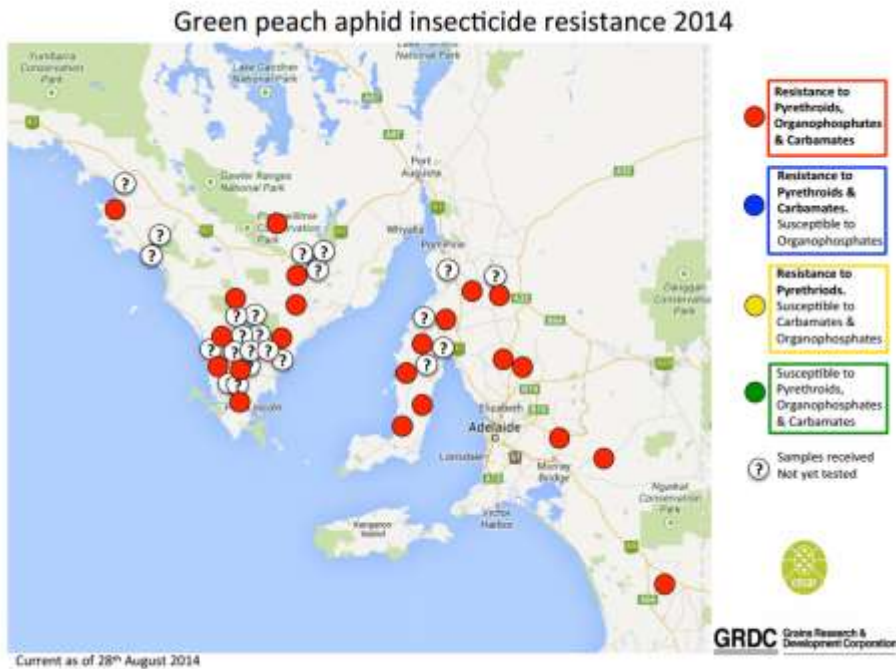

# Green Peach Aphid (*Myzus persicae*)

other aphids species can be/ were present

96% infection efficiency of Beet Western Yellow Virus

insecticide resistance

Cowpea aphid

Cabbage aphid

Turnip aphid

Green peach aphid

# Tolerance to insecticides

Insecticide response curve: comparison of mites

Arthur et al. 2008. *Aust. J Exp. Agric.*

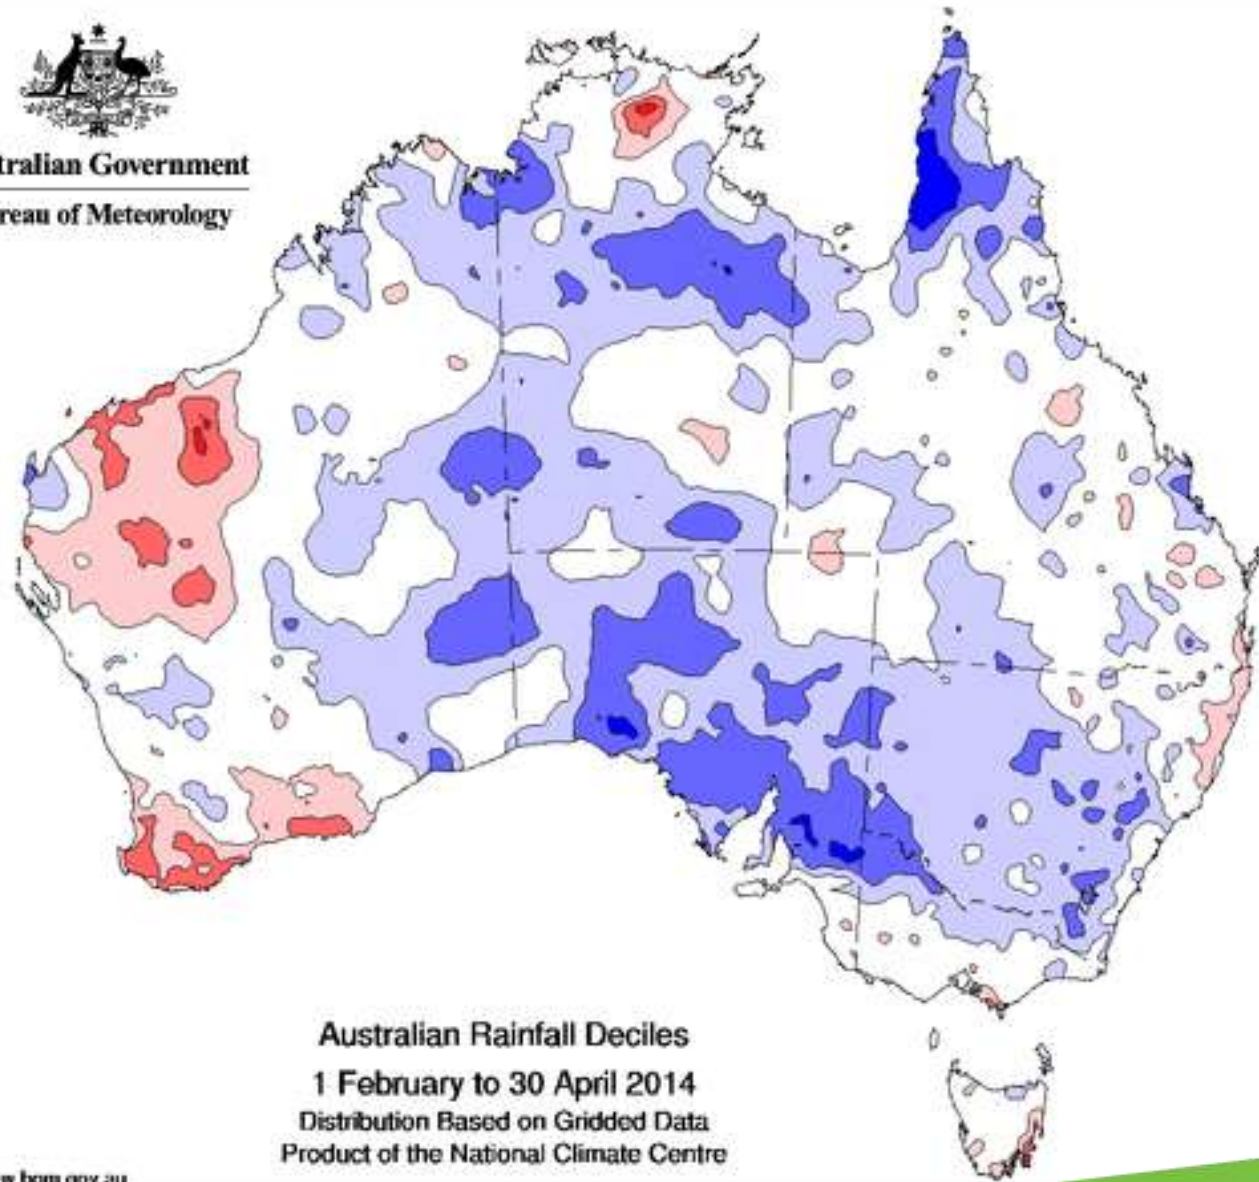

# Cutworms (*Agrotis* spp.)

NDVI STANDARDISED ANOMALY  
1 April to 30 September 2013

2014 great year for establishment pests.

- related to climatic conditions?

Pest control is still heavily reliant on broad spectrum pesticides.

Can not always rely on reactive chemical responses.

Lack of implementation of IPM reflects:

- unpredictable nature of pest outbreaks
- pesticides work immediately
- low/unreliable damage thresholds
- tight profit margins

# Understand population increases

**Table 1**

Examples of reproductive potential of selected invertebrate species occurring in Australia as mentioned in the text. Data includes minimum development temperature (MDT), mature adult life span or length of life cycle if adult life span data is not available, total reproductive output per reproductive individual (fecundity) and intrinsic rate of natural increase ( $R_m$ ) with relevant temperatures ( $^{\circ}\text{C}$ ) for data displayed below in brackets.

| Pest               | Common name  | Species  | Reproductive strategy              | MDT ( $^{\circ}\text{C}$ ) | Life span (days)   | Fecundity         | $R_m$   | Source  |
|--------------------|--------------|--|------------------------------------|----------------------------|--------------------|-------------------|---------|---|
| <i>Gastropoda:</i> |              |  |                                    |                            |                    |                   |         |   |

# Identifying slug threats: indicators

| High risk  | Reduced risk  | Low risk  |
|--|---|---|
| Irrigated and/ or > 500mm  | 500mm -450mm  | <450mm  |
| <b>Above average spring – autumn rainfall ??</b>   | Dry spring hot finish                                     | Drought   |
| Cold wet establishment conditions  | Warm dry conditions                                       |   |
| No till stubble retained   | Burnt only  | Tillage and Burnt stubbles                      |
| Presswheels, raised beds, cloddy seed bed  |   | Full disturbance sowing compacted seedbed       |
| No sheep in enterprise   | Sheep on stubbles   |   |
| Soil with improved moisture holding capacity; i.e. increased clay content and organic matter |   | Poor moisture holding capacity; i.e. Sand no OM |
| Summer volunteers  |   | No volunteers                                   |
| Slow crop establishment  | Quick establishment by earlier sowing of hybrid varieties |   |
| Conventional TT varieties  |   |   |
| Previous paddock history   |   | No slugs  |
| Slug damage  |   | No sclerotinia                                  |
| Rotation: Beans/ canola  | Clean cereal crops  | Poor Cereal crop                                |
| <b>Scelortinnia</b>  |   | No weeds  |

Over forty invertebrate pests, existing as a complex species, often threaten canola crops, but threats vary between seasons.

2014 highlighted the difficulties growers have dealing with extremes, with cutworms and Green Peach Aphids catching many growers unaware.

Discussion points:

More stable crop environments are needed, underpinned by increased crop resilience.

Broad spectrum pesticides are needed, but as the last resort.
